

7th Grade Constructing Explanations

Who? In pairs or small groups

How long? 25 minutes

What does each pair or group need? A smartphone or iPad for taking videos and photos, or blank sheet of paper and a pencil

What to do? Try out three exhibits on the 2nd floor with your small group. Come up with ideas about what is going on in the exhibits by making observations and using those observations to support your ideas. Identify connections between the three exhibits

What counts as evidence? We gather evidence by asking questions, trying things out, and making observations. To decide if you can use your observations as evidence, try repeating your experiment and see if the same thing happens again, have more than one person make the observation and discuss whether you noticed the same thing, or try out another question that relates to your original question.

Pick three exhibits from the following suggestions. If the exhibit you want to use is busy, come back to it later or pick another one from the list.

Biological Self Live Chicken Embryos Self Scope Blood Cells in Your Eye See Under Your Skin Your Longest Cell	Find Yourself Read My Eyes Pulling Together Freeloader	My Self You, Me, We Mood Lighting See Yourself Sweat Center of Attention Looking at Traits	Make It Count Tiling Table Domino Effect Money Talks Money Under the Microscope Growing Money Buy, Sell or Hold Survival Game Spin a Shape
---	--	--	---

With your partner or group, explore the exhibit. Try out new things, and see what happens!

Do some careful noticing. As you are trying things out, talk with your partner about what you observe. Are you all noticing the same thing? If so, try it again, and see if you discover something new.

Next, decide on two things that you observed that are important to understanding this exhibit.

Discuss your ideas. What do you think is going on? This is not about getting the 'right answer'. Talk through your ideas based on your own observations. Come up with two different explanations.

Which of your observations could be used as evidence? Repeat the experiment and see if the same thing happens again, have more than one person make the observation and discuss whether you noticed the same thing, or try out another question that relates to your original question.

After spending time exploring the exhibit, prepare a way to share your observations and experience with others:

Record your observations with a smartphone or iPad.

Decide who will video and who will talk. In your video, include these four things:

- Introduce the three exhibits. Share what you tried and what you noticed.
- Share your explanation for what is happening at each exhibit.
- Show one observation you made that can be used as evidence.
- Share a way the ideas from the three exhibits are connected
- Share one question that you could not answer or a new question that you would like to try at one of these three exhibits.

OR

Record your observations by writing.

On a blank piece of paper, record the following:

- What did you try? What did you notice?
- Write your own explanation about what is happening at these exhibits
- Write down one observation you made that can be used as evidence.
- Write down a way the ideas from the three exhibits are connected
- Write down one question that you could not answer or a new question that you would like to try at one of these three exhibits.
